**Exercise 1: Write a function to print a given string with all vowels removed.**

```
def remove_vowels(string):
    """ Print string, but with no vowels.
        Don't count y as a vowel. """
```

**Exercise 2: Write the following function, which returns a new string with all Python-style comments removed.**

```
def remove_comments(string):
    """ Return a copy of string, but with
        all characters starting with and following
        the first instance of '#' removed. If there
        is no # in the string, return input unchanged.
    """
```
